Assignment: Full-Stack Machine Learning App

Oct 18, 2026 · @Muhammad Ahmad

Task

Build a small machine learning web app in three parts.

1. **ML models:** Train a linear regression model (predict a number, e.g. house price) and a classification model (predict a category, e.g. Iris species) with scikit-learn. Report R^2 and accuracy, then save both models with `joblib`.
2. **Backend (Python FastAPI):** Load both models and create two POST endpoints, `/predict/regression` and `/predict/classification`, that return the prediction as JSON.
3. **Frontend (HTML):** One page with a form for each model that sends the input to the backend and shows the result.

Rules

- You may use ChatGPT for help and explanations.
- Do not copy-paste code. Write all code yourself, with your own understanding.
- You must be able to explain every line of your code.

Submit

A GitHub repository with your code and a short README explaining how to run it.
